A controlled substance is a drug or other substance that the United States Drug Enforcement Administration has identified as having a potential for abuse. My provider shared the following:

- The risks of substance use disorder and overdose associated with the controlled substance containing an opioid.
- Individuals with mental illness and substance use disorders may have an increased risk of addiction to a controlled substance.
- Mixing opioids with benzodiazepines, alcohol, muscle relaxers, or any other drug that may depress the central nervous system can cause serious health risks, including death or disability.
- For a female who is pregnant or is of reproductive age, the heightened risk of short and long-term effects of opioids, including but not limited to neonatal abstinence syndrome.
- Any other information necessary for patients to use the drug safely and effectively as found in the patient counseling information section of the labeling for the controlled substance.
- Safe disposal of opioids has shown to reduce injury and death in family members. Proper disposal of expired, unused or unwanted controlled substances may be done through community take-back programs, local pharmacies, or local law enforcement agencies. Information on where to return your prescription drugs can be found at www.wmtakebackmeds.org or www.michigan.gov/deqdrugdisposal
- It is a felony to illegally deliver, distribute or share a controlled substance without a prescription properly issued by a licensed health care prescriber.

By signing this, I acknowledge the potential benefits and risks of an opioid medication as prescribed by my provider along with the responsibility of properly managing my medication as stated above. Additionally, I was given supplemental education, including side effects, overdose and addiction information when I signed my pain management agreement with Javery Pain Institute.
